

## Make more of your CAD-data!

You can use your existing planning and information material to create photorealistic views and videos. Visualizations support the own planning decisions as well as the reasoning towards your clients and partners **already before project completion!**

## Multiple use of the virtual computer models:

- to revalue project offers,
- to evaluate design variations, materials, light scenes and colors already during the planning phase,
- for presentation and sales purposes.

Compared with conventional wooden models, the virtual computer models can be published in multiple ways on CD, print media and web sites. Project changings can be updated easily at the same time in the computer model.

## BENEFITS

- model creation based on your 2D- or 3D-data, plots, sketches or fotos
- modeling of the ambient terrain surface based on survey data
- simulation of light and shadow conditions (day and night)
- output of the completed computer scenes as a digital foto, video, paper print or as an interactive circular gallery.

## "Keying"

By this technology, 3D computer models can be copied ("keyed") into real photos and video sequences.
